

## PRESS RELEASE

### **MeVis Medical Solutions releasing third generation of MD-JADE:**

#### **Systematic further enhancements to the general diagnostics software for picture archiving systems (PACS systems)**

- \* Optimized workflow and performance
- \* Future-proof technology thanks to standardized software architecture
- \* Now also featuring hardware-accelerated 3D rendering for the first time

**Bremen, October 31, 2008** - MeVis Medical Solutions AG [ISIN: DE000A0LBF4] has today released the latest version of its general diagnostics software as a seamless replacement for earlier versions or for first-time installation. In its third generation, it is again available in Basic, Radiography, Diagnostic, Kinetic and Demonstration versions. Additional options include the support of contrast examinations and three-dimensional imaging.

Distributed by Medos AG (now Nexus / Medos) under the same MD-JADE brand name since 2002, the MD-JADE 3 general diagnostics software covers a wide range of applications for radiography, computed tomography and magnetic resonance imaging. Among other things, it is characterized by efficient RIS (Radiology Information System) integration and the related support for users in practices and at clinics.

In particular, users appreciate MD-JADE on account of its automatically organized diagnostic workflow system (MeVis ADS). As soon as image data is received, it is automatically classified in each individual case and prepared in accordance with defined specifications. At the same time, radiographer workstations can be integrated in the workflow system on an end-to-end basis. As well as this, MD-JADE allows clinic demonstrations to be prepared simply and on a workflow-optimized basis right from the diagnostic workstation.

With this new release, MeVis Medical Solutions is implementing a new generation in the software architecture deployed in MD-JADE. For the first time, this new version has been developed using the general proprietary MeVisAP™ development platform, which is also being used by MeVis Medical Solutions and its partner research institute MeVis Research for developing other products. This provides the technological basis for integrating disease-oriented applications in general diagnostics software as well in the future. MeVis Medical Solutions is concentrating on the development of such specific software solutions which are increasingly being used in the modern medical imaging technology implemented by leading industrial partners.

As part of ongoing product enhancement efforts, the general diagnostics software now also offers modern hardware-accelerated 3D rendering. This allows radiologists, surgeons and also patients to gain an extremely swift overview of all functions. This function is extremely useful in several respects. For example, it can be used in organ imaging to highlight specific conditions
